Sheet 2 of 7

Max Point Defect Density Surface 1 inside 170 mm diameter	5 per 4 mm ²
Max Point Defects Surface 1 outside 170 mm to 255 mm diameter	N/A
Max Point Defects Surface 2 inside 170 mm diameter	100
General to All Surfaces	
Coating Thickness Uniformity	Fractional Change <0.001 over 170 mm diameter. If the physical thickness variation of the coating cannot be measured with a profilometer or inferred interferometrically, it may be inferred from the wavelength shift of the coating as a function of position.
Coating Deletive Weyslength Uniformity	Erectional Change of 001 over 170 mm diameter
Coating Relative Wavelength Uniformity Coating Area	Fractional Change <0.001 over 170 mm diameter. To Bevel
Coating Area	Once Witness Piece Per Run:
	Coating to resist adhesion test per MIL-C-48497A 4.5.3.1 Adhesion (snap tape). MIL-C-4.5.3.2 Humidity (120F 95% RH for 24 hours), combined with before/after spectrophotometer scan from 400 - 2500 nm,
	marking the specimen ensure the same area is scanned. There should be no measureable spectral shift.
Witness Sample Durability Testing	MIL-C-4.5.3.3 Moderate Abrasion (cheesecloth rub).
Surface 1	NOTE: ARROWS ON OPTIC SIDE POINT TO SURFACE 1
Coating Type	Beamsplitter

	For all layers in the design, measured thickness
	data from the deposition for each run), designed
	thicknesses, and measured indices of refraction at
2. Measured and Design Layer	both 1064 nm and 532 nm for both coating
Thicknesses	materials (based on individual layers).
	On a representative witness piece for each run,
	spectrophotometer graphs of reflectance and
	transmission of Surface 1 (HR coating) from 350-
	2500 nm before it is coated, between Surface 1 and
	Surface 2 coating, and after coating is completed.
	LIGO's preference is to have all spectrophotometer
3. Surface 1 Spectrophotometer Scans	data be provided in Excel spreadsheet format.
	On a representative witness piece for each run,
	spectrophotometer graph of reflectance of Surface
	2 (AR coating) from 350-2500 nm before it is
	coated, between Surface 1 and Surface 2 coating,
	and after coating is completed. LIGO's preference
	is to have all spectrophotometer data be provided
4. Surface 2 Spectrophotometer Scans	in Excel spreadsheet format.
	Maps of scatter, absorption, and transmission over
	central 160 mm diameter with optic orientation
	specified. Scatter should be measured accurately
	to \pm 1 ppm, absorption to \pm 0.1 ppm, and
5. Scatter Maps.	transmission to ± 0.001 .

	METHOD 1.
	The surface is examined visually by two observers independently. The examination is done against a dark background using a fiber optic illumination system of at least 200 W total power. A 100% inspection of the surface is carried out. Pits and scratches down to 2 micrometers in width can be detected using this method of inspection. Any scratches or sleeks that are detected will be measured using a calibrated eyepiece.
6. Scratches & Point Defects Methods 1&2 (Hand Sketch).	METHOD 2. Further inspection will be done with a minimum 6X eyeglass using the same illumination conditions, again with two observers. Sleeks down to 0.5 micrometers wide can be detected using this method. The surface will be scanned along one or two chords from centre to edge, then at ten positions around the edge, and ten to fifteen positions near the centre. METHOD 3.
	An inspection is then carried out with a dark or bright field microscope, with 5x objective at four positions at each of the following locations: a) Within 10mm of the center of the surface.
	b) Equally spaced along the circumference of a centered, 60 mm diameter circle.
7. Scratches & Point Defects Method 3 (Digital Images).	c) Equally spaced along the circumference of a centered, 120 mm diameter circle.
8. Durability Test Data & Samples.	All samples from the durability tests and data, including spectrophotometer scans of the representative coating on each side in an Excel spreadsheet.
