# Motivation and Outline

- Motivation
  - Look for possible continuous sources in the band
  - Quasi-radial oscillations of rotating white dwarfs
- Outline
  - Identify frequency range
  - Determine gravitational radiation
  - Estimate stochastic background level

# Identifying the Frequency Range

# White Dwarf Properties and Resonant Frequencies

$\rho_c$ (g/cm <sup>3</sup> )	$M_0$ ( $M_\odot$ )	$M$ ( $M_\odot$ )	$\Omega_{\max}$	$Q^0_{\max}$ (kg m <sup>2</sup> )	$\omega$
$1.716 \times 10^6$	0.498	0.572	0.196	$3.872 \times 10^{42}$	0.757
$1.544 \times 10^7$	0.867	0.976	0.476	$2.315 \times 10^{42}$	0.766
$5.377 \times 10^7$	1.049	1.164	0.768	$1.338 \times 10^{42}$	1.077
$1.287 \times 10^8$	1.145	1.254	1.063	$8.095 \times 10^{41}$	1.399
$7.036 \times 10^8$	1.245	1.34	2.042	$2.687 \times 10^{41}$	2.001
$2.091 \times 10^9$	1.257	1.339	3.105	$1.217 \times 10^{41}$	1.299

# Determining Strain Amplitude

- Assume oblate shape due to rotation

QuickTime™ and a Animation decompressor are needed to see this picture.

- Oscillation is self-similar and is described by:

$$x_{\alpha} = x_{\alpha}^0 (1 + \eta \sin(\omega t))$$

- Quadrupole moment given by

$$Q_{ij} = \int \rho \left( x_i x_j - \frac{1}{3} x^2 \delta_{ij} \right) dV = Q_{ij}^0 (1 + \eta \sin(\omega t))$$

Choose  $z$ -axis along rotation axis:  $Q_{zz}^0 = -2Q_{xx}^0 = -2Q_{yy}^0 = -2Q^0$

# Polarizations

In TT gauge with  $z$ -axis along the wave vector:

$$h_{+} = h_{xx} - h_{yy} = \frac{4GQ^0\eta\omega^2}{c^4 r} \sin^2 \theta \sin(\omega t)$$

$$h_{\times} = 2h_{xy} = 0$$

where  $\theta$  is the angle between the wave vector and the white dwarf axis of rotation

## Estimating the Background Level

- Numerical calculations give  $Q^0_{\max}$  for select white dwarfs rotating at  $\Omega_{\max}$
- Results are from an expansion in a dimensionless parameter proportional to  $\Omega^2$
- Use  $Q^0 = (\Omega/\Omega_{\max})^2 Q^0_{\max}$
- Integrate over  $\theta \Rightarrow \sin^2\theta \rightarrow 1/2$

$$h_+ = 5.35 \times 10^{-65} \left( \frac{1 \text{ pc}}{r} \right) \left( \frac{\Omega}{\Omega_{\max}} \right)^2 Q^0_{\max} \omega^2 \eta$$

# White Dwarf Properties and Resonant Frequencies

$\rho_c$ (g/cm <sup>3</sup> )	$M_0$ ( $M_\odot$ )	$M$ ( $M_\odot$ )	$\Omega_{\max}$	$Q^0_{\max}$ (kg m <sup>2</sup> )	$\omega$
$1.716 \times 10^6$	0.498	0.572	0.196	$3.872 \times 10^{42}$	0.757
$1.544 \times 10^7$	0.867	0.976	0.476	$2.315 \times 10^{42}$	0.766
$5.377 \times 10^7$	1.049	1.164	0.768	$1.338 \times 10^{42}$	1.077

$2.091 \times 10^9$	1.257	1.339	3.105	$1.217 \times 10^{41}$	1.299

# Expected Strain Amplitudes

- Maximum values (assume  $\Omega = \Omega_{\max}$ )
- Assume  $r = 1$  pc,  $\eta = 10^{-4}$

# Observed Rotation Rates

Kawaler (astro-ph/0301539)

- Spectroscopic methods:

- $M \sim 0.6 M_{\odot}$
- $\Omega \sim 0.0036 \text{ Hz}$
- $h \sim 4.1 \times 10^{-26}$

- Asteroseismic methods:

- $M \sim 0.6 M_{\odot}$
- $\Omega \sim 5.6 \times 10^{-5} \text{ Hz}$
- $h \sim 9.7 \times 10^{-30}$

# Conclusions

- Vibrating white dwarfs are potential sources of gravitational radiation in the mid-frequency range.
- Assuming a mean distance of  $r$  pc to nearest vibrating white dwarf, an upper limit of  $\sim 10^{-23}/r$  can be placed on the expected level.
- If the high rotational rates of Kawaler are used, a more reasonable upper limit would be  $\sim 10^{-26}/r$ .
- If the low rotational rates are used, the upper limit is an almost negligible  $\sim 10^{-30}/r$ .
- Source of energy needs to be determined.
- Standard inflation gives  $h \sim 10^{-27} - 10^{-29}$  in this frequency range.
