Pole/zero Determination

Bode Plot

```
BodePlotEx[-eomact2Path[2 π i 1*^6 f] /. prmpa98 /. prmActEom2Path,
  {f, 0.00001, 100}, MagnitudeRange → {-30, 31}, Evaluate[plotopt], XAxisLabel → "MHz"]
```

Single Path Configuration with Old Parameters

Remove C61 in AD829 path.

The AD829 path seems to reduce the gain peaking around 10 MHz, but otherwise has little effect below 1 MHz.

```
BodePlotEx[-eomact2Path[2 π i 1*^6 f] /. prmpa98 /. C61 → 0 // . prmActEom2Path,
{f, 0.00001, 100}, MagnitudeRange → {-30, 31}, Evaluate[plotopt], XAxisLabel → "MHz"]
```

New Single Path Configuration (no PMC pole)

We add a passive low pass filter to the output and remove the U13 path all together. C61 has changed to 560 pF and goes to ground with R96 → 0 and R95 → ∞.

Transfer Function

```
In[52]:= prmActEom = {R90 → 100*^3, R88 → 1*^3, C51 → 47*^-12,
  R85 → 3*^3, C48 → 220*^-9, C49 → 0, R86 → 10*^3, R87 → 499, R89 → 10*^3,

Sensing Path

Phase-Frequency Discriminator (Laser Locking)

A phase-frequency discriminator is used for laser locking. The standard LIGO PFD circuit is described in LIGO-E1200114. The PCB LIGO-D1002471 is used with a modification to make it higher bandwidth. This is described in LIGO-E1700100.

Transfer Function

In[73]:=

```

  PhaseRange → {-200, 0}, Evaluate[plotoptn[3]], XAxisLabel → "MHz"]
```

Mixer (Cavity Locking)

The FET IQ demodulator is used for locking to a reference cavity. The standard LIGO FET IQ demodulator circuit is described in LIGO-E1200113. The PCB LIGO-D0902745 is used with a modification to make it ultra-fast bandwidth. This is described in LIGO-E1100044.

Transfer Function

```
In[76]:= prmDemod = {gDemod → 5.5, pDemod1 → 2 π 15.9*^6, pDemod2 → 2 π 6.17*^6, qDemod2 → 0.761};
