

LIGO Live Noise Budget

By Samuel Scherf

Background

- “LIGO (Laser Interferometer Gravitational-Wave Observatory) is a large-scale physics experiment and observatory to detect cosmic gravitational waves”
- Made over 50 detection's of gravitational waves
- Bounce laser back and forth until space is distorted

Project

- Create a live noise budget for site operators

 - * Useful for monitoring and testing

- Noise budget is estimated table motion based on noise sources

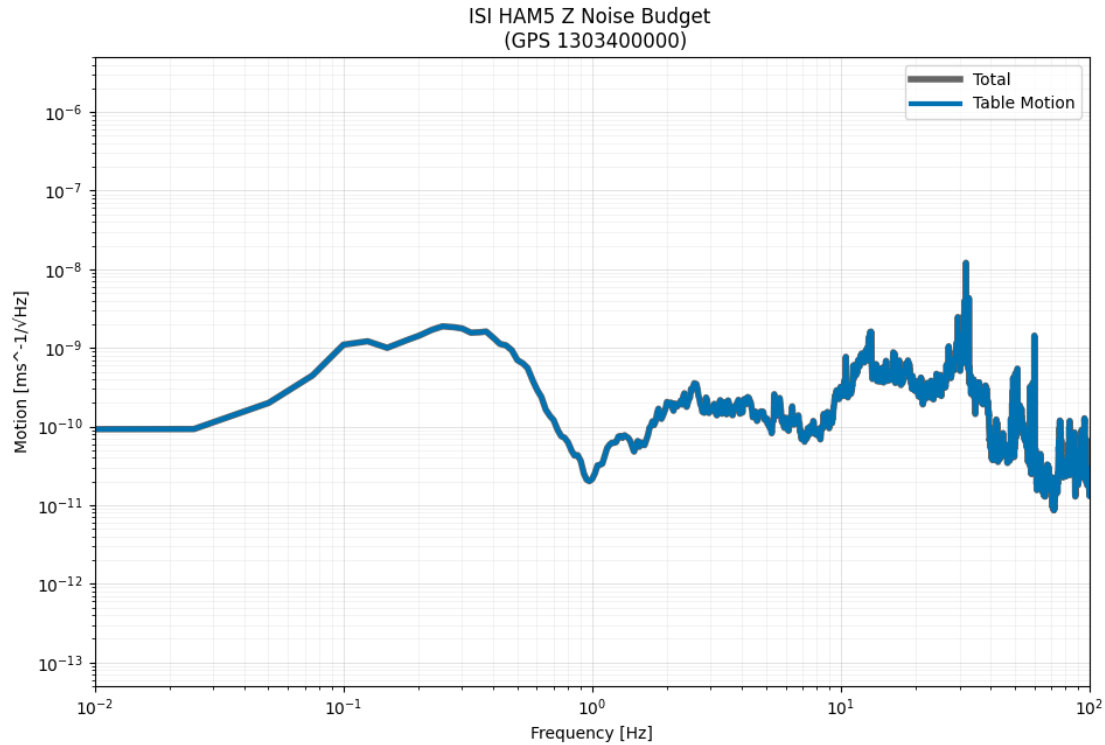

Table Motion

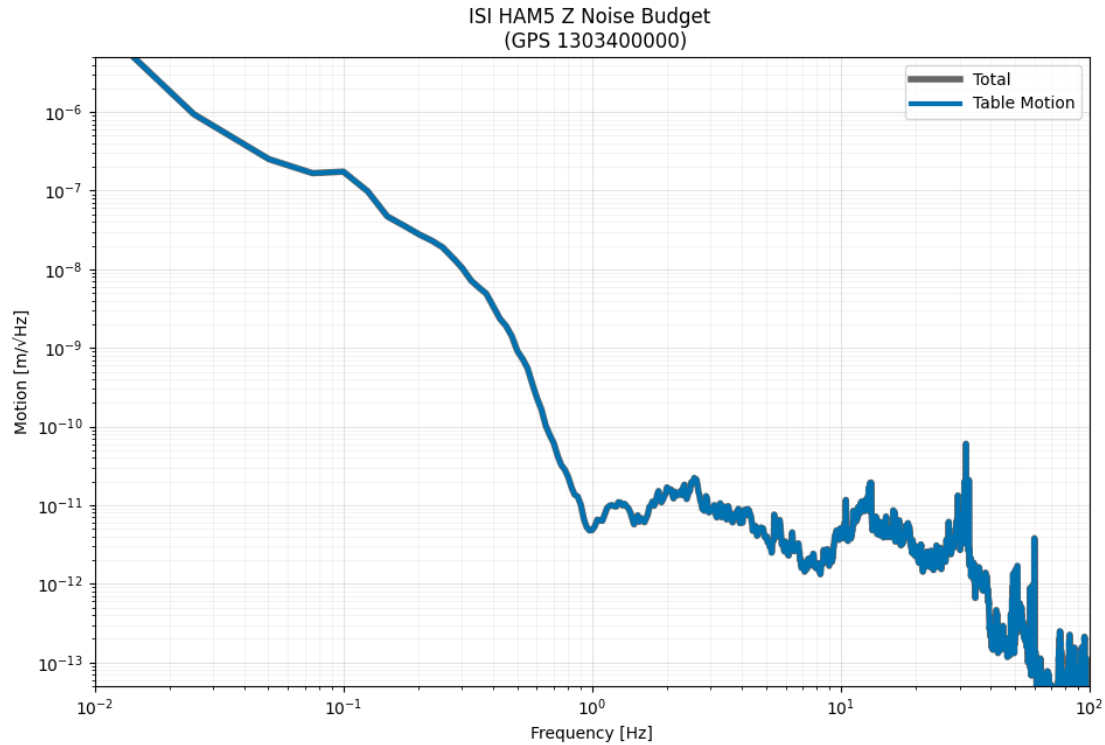

- Table motion is taken from a “GS-13” seismometer on the table
- This itself is very useful to look at so we take a Fourier transform

To do

- Create interface to view all the budgets
- Expand to more chambers
- Resolve model bugs
- Fix tilt term
